

Week 10 – Learning Task 2 & 3

Sentence Matching: Data + Description

Name: _____

Date: _____

Read the descriptions (1–10). Match each sentence to the correct visual data type (A–E).

Write the correct letter next to each sentence.

Visual Data Types

A. Line Graph

(Chip yield rate from 2020–2024)

B. Bar Chart

(Defect rate comparison across four production sites)

C. Table

(Temperature readings and output voltage values)

D. Pie Chart

(Percentage distribution of defect types)

E. Line Graph (Two Lines)

(Power consumption of Machine A vs. Machine B over 6 months)

Sentences

A

The number of chips produced dropped by 5% between Q1 and Q2.

E

~~B~~

Machine A consumed slightly more power than Machine B throughout the six-month period.

C

The temperature increased from 45°C to 52°C, while the output voltage decreased from 5.1V to 4.8V.

B

E

Site C recorded the highest number of defective units, whereas Site A had the lowest.

D

Surface contamination accounted for 35% of total defects, making it the most common issue.

A

Overall, chip yield improved steadily from 88% in 2020 to 96% in 2024.

D

Cracks represented a smaller proportion of defects compared to misalignment errors.

E

~~A~~

The data shows a sharp increase in power consumption in April before stabilizing in May.

C

~~E~~

Output voltage remained constant at 5.0V despite fluctuations in temperature.

B

~~F~~

Production Site B performed better than Site D in terms of defect reduction.

Part B – Language Focus

Identify the language feature used in each sentence.

Write:

C = Comparative

T = Trend phrase

Q = Quantifier/Time expression

Example:

“The yield increased steadily from 2021 to 2023.” → T, Q

TQ “Dropped sharply by 8% in one quarter.”

CQ “Higher than the previous year.”

CQ “Remained relatively stable over the testing period.”

Q “From March to June.”

C “Slightly lower than expected.”

Learning Task 3

Model Paragraph: Steel Production Output

The bar chart illustrates the monthly steel production output of a manufacturing plant over a six-month period from January to June 2024. In January, output stood at 3,800 tonnes, which was below the 4,500-tonne target. However, production increased steadily over the following months, reaching 4,600 tonnes in March and peaking at 4,900 tonnes in April. A notable dip occurred in May, when output fell back to 4,300 tonnes, suggesting a temporary disruption in the production process. Despite this decline, the plant recovered strongly in June, recording its highest output of 5,200 tonnes — well above the monthly target. Overall, the data shows a general upward trend in production capacity, with the plant consistently meeting or exceeding its target by the second quarter.
